

Miller-Karr Technologies, Inc. can save you time and money with our anchoring and installation products. We supply industry standard fasteners for telecomms and utilities but also offer value-added engineering services for the development, design, or customization required to meet your specific applications. Our standard metric anchors are a cost effective solution for seismic zones 0 thru 4 and are carbon steel with bright yellow zinc plating. For extreme environments all our metric anchors are also available in 316 stainless steel.

A few examples of our metric line and custom capabilities include:

The MK1201AY with its large isolator bushing and plate washer is our top item. A 12 mm threaded anchor x 145 mm long with slotted head and separate hex nut. The isolator bushing protects against inadvertent grounding that can be caused by shallow rebar. This anchor is ideal for critical applications such as Central Office installations. A miniwasher and mini isobushing are also available.

SLB & SLS standard 10 mm, 12 mm, and 18 mm anchors. These standard metric anchors are available with either the hex nut and slotted shaft or stud style. Additional washers, locking hardware, or isolator bushings can easily be added. The 18 mm anchors are ideal for mounting battery racks.

Kits are typically combinations of isolator pads stamped from engineering grade laminates to the exact footprint of your enclosure or rack and also contain insulated anchors and leveling shims of three different thicknesses. Customized kits reduce administrative costs for ordering and the control of on-site inventory. Lower costs are also obtained through purchase of only the necessary number of parts per site—buying parts in bulk quantities don't net savings when the excess items are discarded.

High dielectric values of the pads, shims, and isolator bushings ensure that unintentional grounding (earthing) does not become an issue.

Metric wedge, female wedge, and drop-in anchors are now available to meet your international and universal fastening requirements. These products are suited for light to medium loading applications. Our 12 mm drop-ins are ideal for ceiling suspended ladder racks, raceways, and ducting. We can also supply metric threaded rods at extremely competitive prices.

Introducing the only fully assembled, 12 mm metric, raised floor anchor available in the market today!! There's no need to order separate components anymore. The overall 610 mm (24 inch) length of the threaded rod provides a working dimension that is cut to suit for floors up to 508 mm (20 inches) in height. This product will save you both time and money on your raised floor installations.

Custom products at competitive prices.
